

DIY FRIDAYS

PROJECT : Concrete Moisture Testing with Cellophane

#DIY102

TOOLS & MATERIALS: Cellophane, Measuring Tape, and Duct Tape

Step 1

Select your test site. If working in a large area, it's always a good idea to test multiple sites.

Step 2

Sweep the test site. Insure the test area is clean and free of debris and sealants.

Step 3

Measure out a 12" square of cellophane. No need to be exact. A piece of plastic bag will work as well.

Step 4

Lay the cellophane out on the floor, and tape all four sides securely to the floor.

Step 5

After at least 16 hours, it's time to remove the cellophane.

Step 6

If it looks the same, good. If a dark area remains, more thorough testing should be performed.
